D2: Revised Requirements, Problem Breakdown & Task Allocation

Topic: Feedback Pouring with Kinova Arm

Software Development Project

Mentor: Minh Nguyen

Vicky Prince Victor
Salvin George

Pallavi Aithal Narayan
Sai Anudeep Sajja

Problem Description

The task of pouring liquid or cereal is a common one in RoboCup competitions, implementing this task in Kinnova Arm (Freddy) with some feedback to ensure accuracy and consistency instead of previous timer based approach. [1]

[1] Feedback for Pouring behaviour (Toyota HSR) ([HBRS-SDP/ss22-pour-feedback github.com](https://github.com/HBRS-SDP/ss22-pour-feedback))

Problem Goals

- Compare HSR behaviour with Kinova Arms/ Freddy
- Explore feedback methods using available sensors **on the robot**(end-effector force estimation, RGB/-D camera(s))
- Perceive the source and target container and estimate the orientation and distance between them
- Feedback must be fast enough for controlling the pouring motion(minimum $\sim 20\text{Hz}$)

Title: US 1	Priority: Medium	Estimate:
<p>User Story:</p> <p>As a user I want to visualise the Forces while the arm is holding, pouring and emptying the container So that I can estimate the amount of object it is holding</p>		
<p>Acceptance Criteria:</p> <p>Scenario 1.1 Visualisation of forces for different scenarios of pouring.</p>		

Requirement Specifications

Title: US 2	Priority: Medium	Estimate:
User Story: As a user, I want the robot to identify the object inside the container and measure the level So that it can accurately pour the specified quantity of liquid.		
Acceptance Criteria: Scenario 2.1 The robot must be able to identify the type of object inside the container. Scenario 2.2 The robot must be able to measure the current liquid/cereal level in the container.		

Title: US 3	Priority: High	Estimate:
User Story: As a user, I want the robot to estimate the weight of the object, So that it can safely pour the liquid without spilling.		
Acceptance Criteria: Scenario 3.1 The robot must be able to estimate the weight of the object with a reasonable margin of error.		

Title: US 4	Priority: High	Estimate:
<p>User Story:</p> <p>As a user I want to fix the position of targeted container with respect to arm base and give to the Robot So that it can accurately align the end effector for pouring.</p>		
<p>Acceptance Criteria:</p> <p>Scenario 4.1 The robot must be able to identify the targeted container.</p> <p>Scenario 4.2 The robot must be able to estimate the dimensions and position of the targeted container with respect to the arm base with a reasonable margin of error.</p> <p>Scenario 4.3 The robot should continuously adjust the yaw/roll to move the end effector towards the targeted container with a reasonable margin of error.</p>		

Title: US 5	Priority: Medium	Estimate:
User Story: As a user I want want the robot to pour the predefined amount of liquid/cereal So that it can accurately dispense the specified amount of liquid/cereal.		
Acceptance Criteria: Scenario 5.1 The robot must be able to accurately dispense the specified amount of liquid into the target container.		

Collaboration Plans

Framework and tools

ROS 1 / ROS 2

C++/ Python

Kinematics and Dynamics Library(yet to be explored)

Team Collaboration

Slack

GitHub

Visual Studio Code

Resources

- Weight estimation example using wrist force sensor(special permission required)[1]
- Previous SDP project [2]
- More advanced liquid level estimation methods [3][4]

[1] Kortex API documentation, specifically on end effector wrench (named `tool_external_wrench_force_*`).
